

Prescribed Grazing

What is Prescribed Grazing?

Prescribed grazing is using grazing animals to manage the controlled harvest of vegetation. This best management practice (BMP) is used to improve or maintain forage for livestock health, reduce runoff frequency and volume, promote economic stability and lessen the impact of agriculture on water quality.

What are the benefits of this practice?

- Improves or maintains the health and vigor of plant communities
- Improves or maintains quantity and quality of forage for livestock health and productivity
- Improves or maintains water quality and quantity
- Reduces accelerated soil erosion and maintains or improves soil condition
- Improves or maintains the quantity and quality of food and/or cover available for wildlife
- Promotes economic stability through grazing land sustainability

Where can this practice be applied?

This BMP can be applied to all lands where grazing animals are managed.

Agriculture in the Arroyo Colorado Watershed

The Arroyo Colorado Watershed is 706 square miles and runs from McAllen to the Lower Laguna Madre. The water body is impaired for dissolved oxygen, bacteria and legacy pollutants. In 2007, local stakeholders developed and published *A Watershed Protection Plan for the Arroyo Colorado Phase I* that identifies strategies to address water quality issues. The plan is currently being implemented throughout the watershed.

Agricultural production comprises almost half of the land within the Arroyo Colorado Watershed. A goal of the watershed protection plan is to have best management practices implemented on half of the irrigated agricultural lands by 2015. Runoff from these agricultural lands carries nutrients and sediments, which contribute to the above impairments in the Arroyo Colorado.

Be a part of conserving this precious natural resource by adopting a BMP and lessen the impacts of agriculture on water quality.

Prescribed Grazing

What can you do and who should you contact?

The Texas State Soil and Water Conservation Board (TSSWCB) and the USDA Natural Resources Conservation Service (NRCS) have multiple programs that offer technical and financial assistance to agricultural producers to implement BMPs on their farm.

Environmental Quality Incentives Program (EQIP), offered by NRCS, is an annual program with specific time frames and registration periods.

TSSWCB offers assistance through its Water Quality Management Plan (WQMP) Program. A WQMP is a voluntary site-specific plan developed by local Soil and Water Conservation Districts for producers that includes land and production practices as well as management measures. Both WQMPs and EQIP are designed to reduce nonpoint source pollution and provide cost share assistance.

If you have questions, you may also contact the Texas AgriLife Extension Service agent for your county.
